Annual figures for the European high-risk surgical population

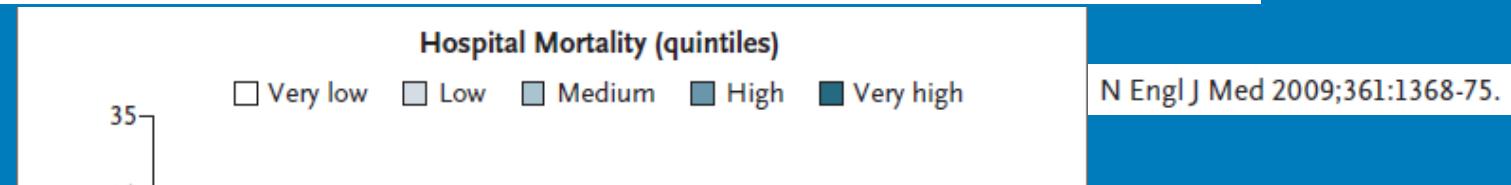

Ghaferi A. N Engl J Med 2009; 361: 1368-75

Weiser T Lancet 2008; 372: 139-144; Pearse R Crit Care 2006; 10: R81

- 20 million in-patient general procedures
- 2.6 million high-risk procedures
- 1.3 million patients develop complications
- > 300,000 deaths in hospital

Variation in Hospital Mortality Associated with Inpatient Surgery

Amir A. Ghaferi, M.D., John D. Birkmeyer, M.D.,
and Justin B. Dimick, M.D., M.P.H.

N Engl J Med 2009;361:1368-75.

Table 2. Incidence of Major Complications and Mortality after Complications, According to Hospital Quintile of Mortality.

Variable	Very Low Mortality	Low Mortality	Medium Mortality	High Mortality	Very High Mortality	Odds Ratio for Very High vs. Very Low Mortality (95% CI)
<i>percent of patients</i>						
Incidence of complication						
Pneumonia	2.0	2.4	1.8	2.4	2.1	1.06 (0.70–1.60)
Mechanical ventilation >48 hr	6.6	7.1	6.3	7.0	8.1	1.24 (0.99–1.56)
Mortality after major complication						
Pneumonia	16.5	15.9	20.6	17.0	25.5	1.73 (1.22–2.44)
Mechanical ventilation >48 hr	20.6	23.1	28.7	27.3	31.0	1.73 (1.36–2.20)

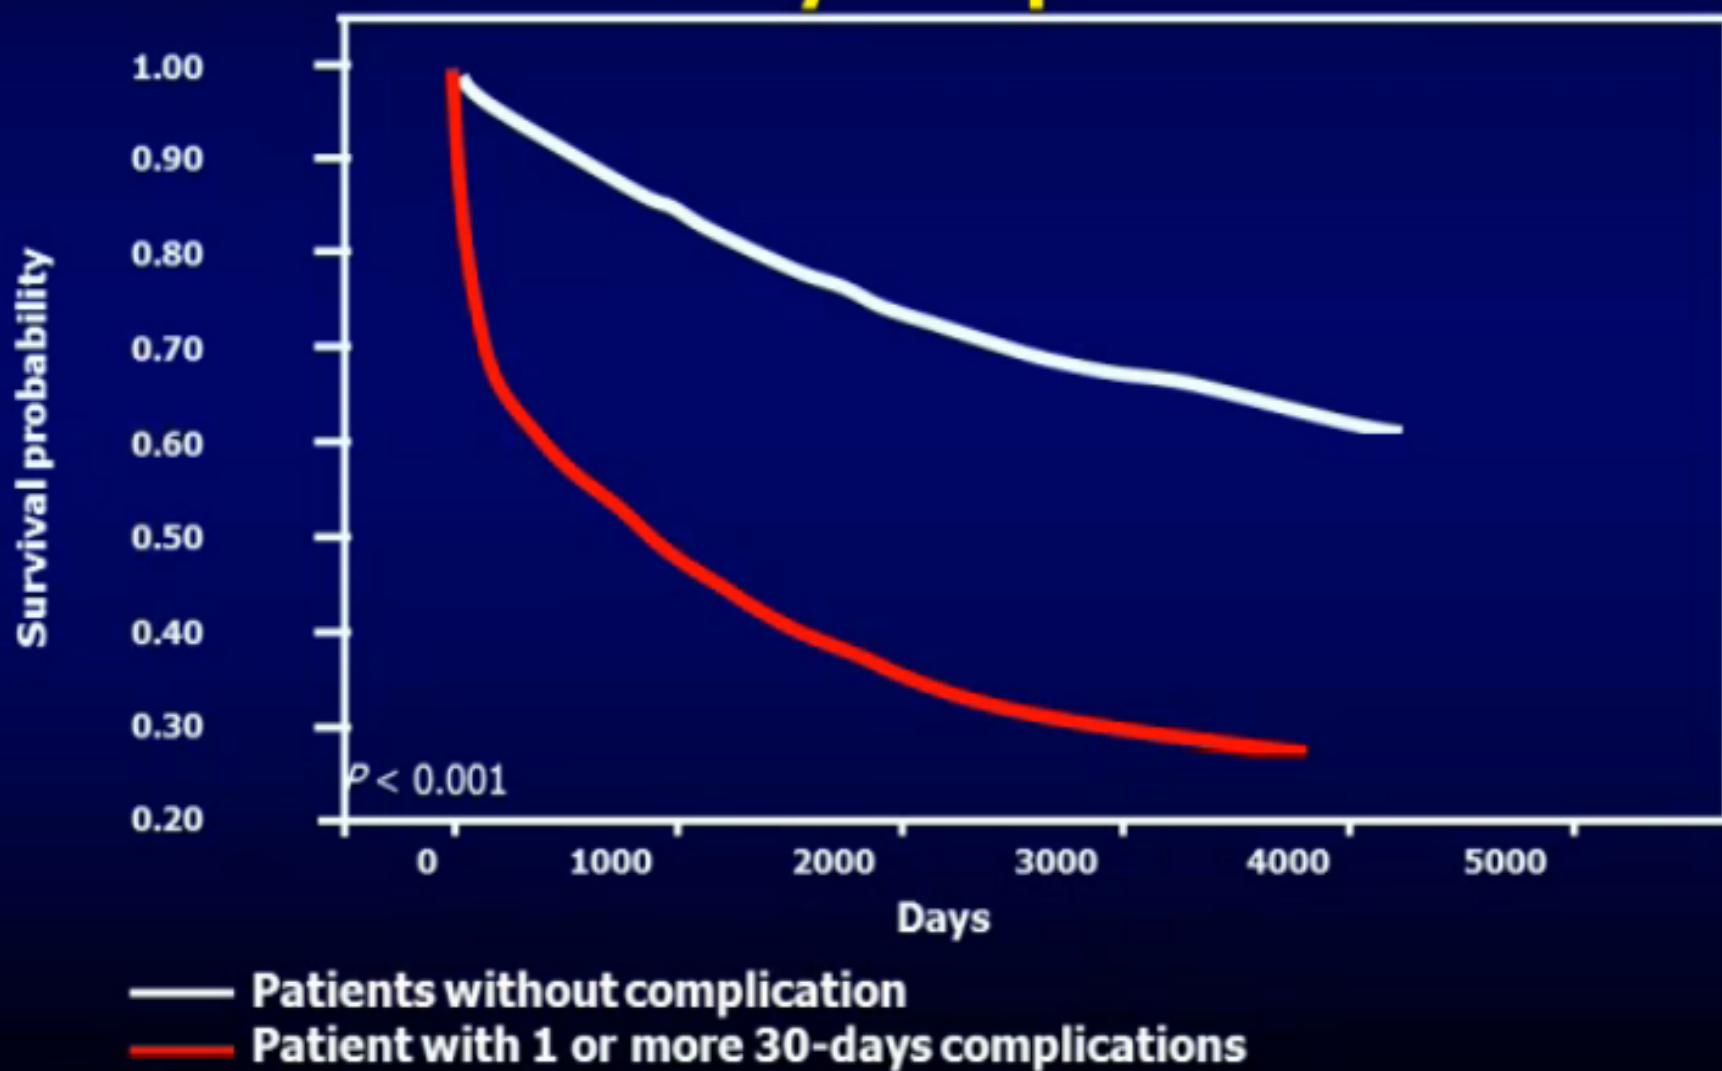

Figure 1. Rates of All Complications, Major Complications, and Death after Major Complications, According to Hospital Quintile of Mortality.

Although rates of all complications and major complications did not vary significantly across hospital mortality quintiles, the rate of death in patients with major complications was almost twice as high in hospitals with very high overall mortality as in those with very low overall mortality (21.4% vs. 12.5%, $P<0.001$).

Determinants of Long-Term Survival After Major Surgery and the Adverse Effect of Postoperative Complications

Khuri SF et al. Ann Surg 2005;242: 326–343

Strategies to prevent postoperative pulmonary complications

Guldner, Pelosi, Gama de Abreu Curr Opin Anesthesiol 2013, 26:141–151

Preoperatively

- Assess general physical status and identify risk factors
 - Preoperative SpO₂
 - Measurement of albumin
- Preoperative “optimization”
 - Cessation of smoking?
 - Treat infection and/or bronchospasm
 - Alleviate anemia
- Education regarding physiotherapy

Strategies to prevent postoperative pulmonary complications

Guldner, Pelosi, Gama de Abreu Curr Opin Anesthesiol 2013, 26:141–151

Postoperatively

- Selective use of nasogastric tube
 - If PONV
 - Inability to oral feeding
 - Abdominal distension
- Effective pain management and minimize respiratory depression
- Early postoperative respiratory therapy
 - Incentive deep breathing
 - Early use of CPAP or BiPAP
- Early hydration, mobilization of secretions and ambulation

Strategies to prevent postoperative pulmonary complications

Guldner, Pelosi, Gama de Abreu Curr Opin Anesthesiol 2013, 26:141–151

Intraoperatively

- Anaesthetic/surgical plan
 - Consider regional anesthesia for pain control
 - Consider laryngeal mask
 - Choose short-acting drugs/avoid PORC
 - Limit duration of surgery
 - If feasible use laparoscopic techniques
 - Reduce emergent surgery
- Ventilatory strategies
 - Protective ventilation (Low tidal volume 6-8 ml/kg IBW/PEEP)
 - Limit high oxygen concentrations
 - Maintain PaCO_2

Ventilator-induced Lung Injury in Healthy and Diseased Lungs

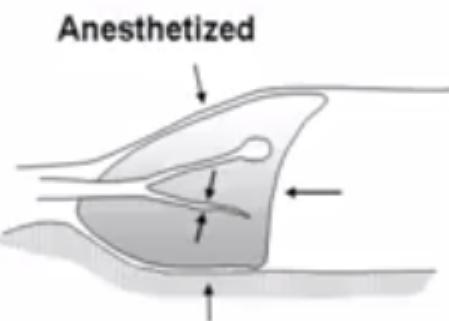

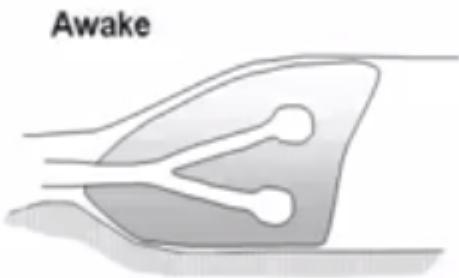

Better to Prevent than Cure!

Paolo Pelosi, M.D.,* Patricia R. M. Rocco, M.D., Ph.D.[†]

Anesthesiology 2011; 115:923-5

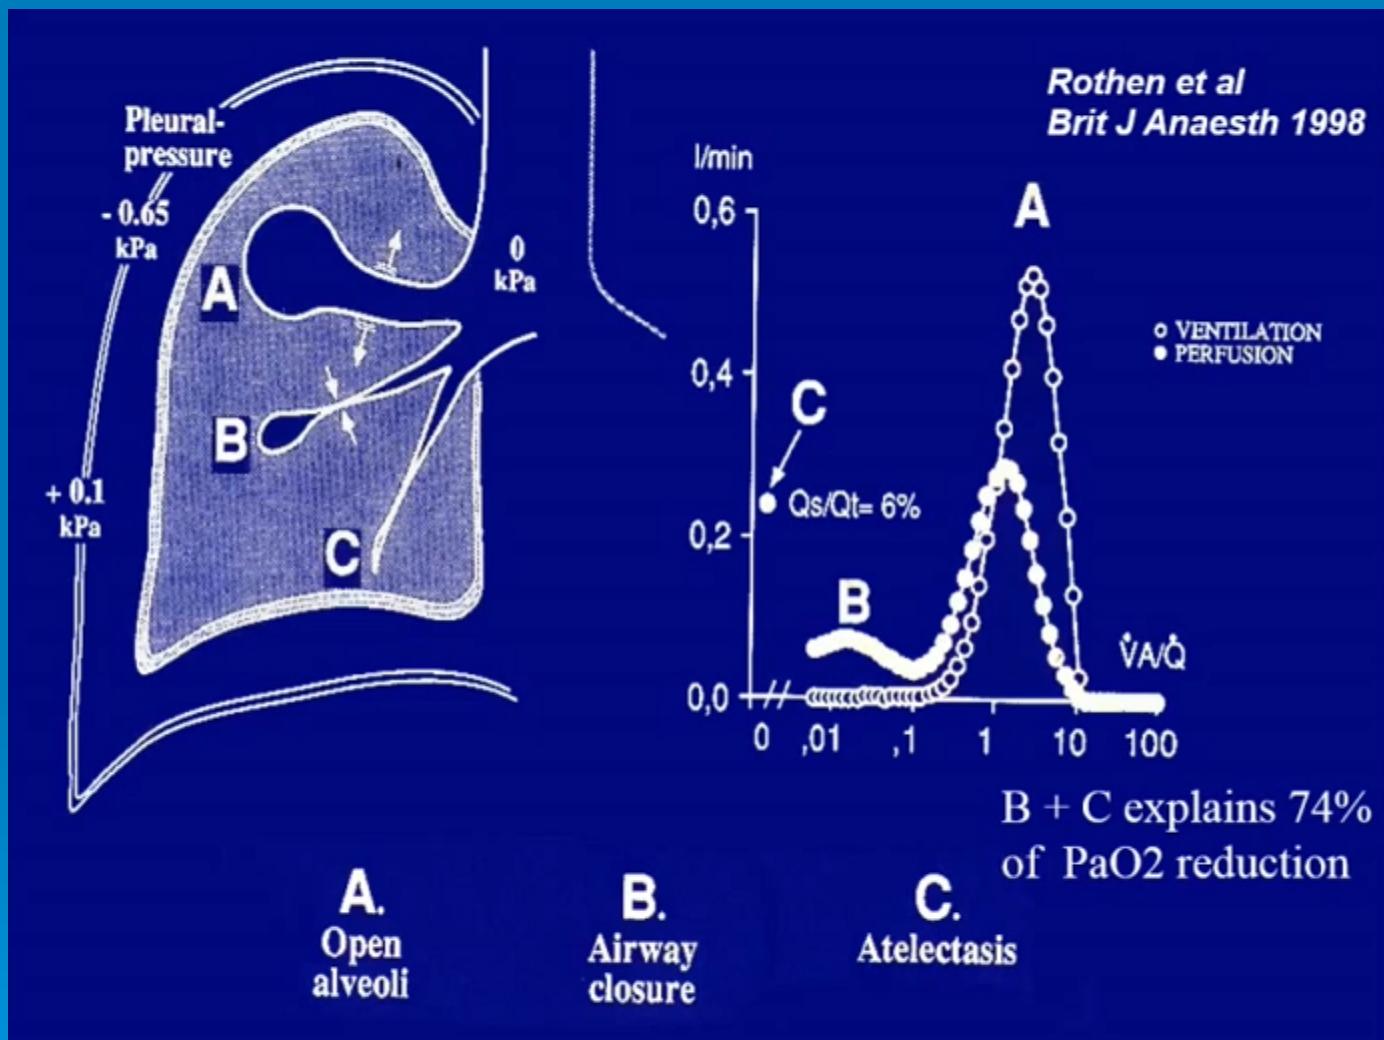

“... the experimental data provided suggest that nonprotective ventilation in healthy lungs makes the lungs weaker.”

Anesthesia

1. FRC ↓ loss of tone
2. C_{lung} ↓ smaller volume
3. Raw ↑ reduced airway dimensions
 - airway closure
 - atelectasis

VALI: TV

A multicentre observational study of intraoperative ventilatory management during general anaesthesia: tidal volumes and relation to body weight

Jaber S et al. Anaesthesia 2012; 67, 999–1008

2161 patients between January and June 2006 in 97 anaesthesia units from 49 French hospitals

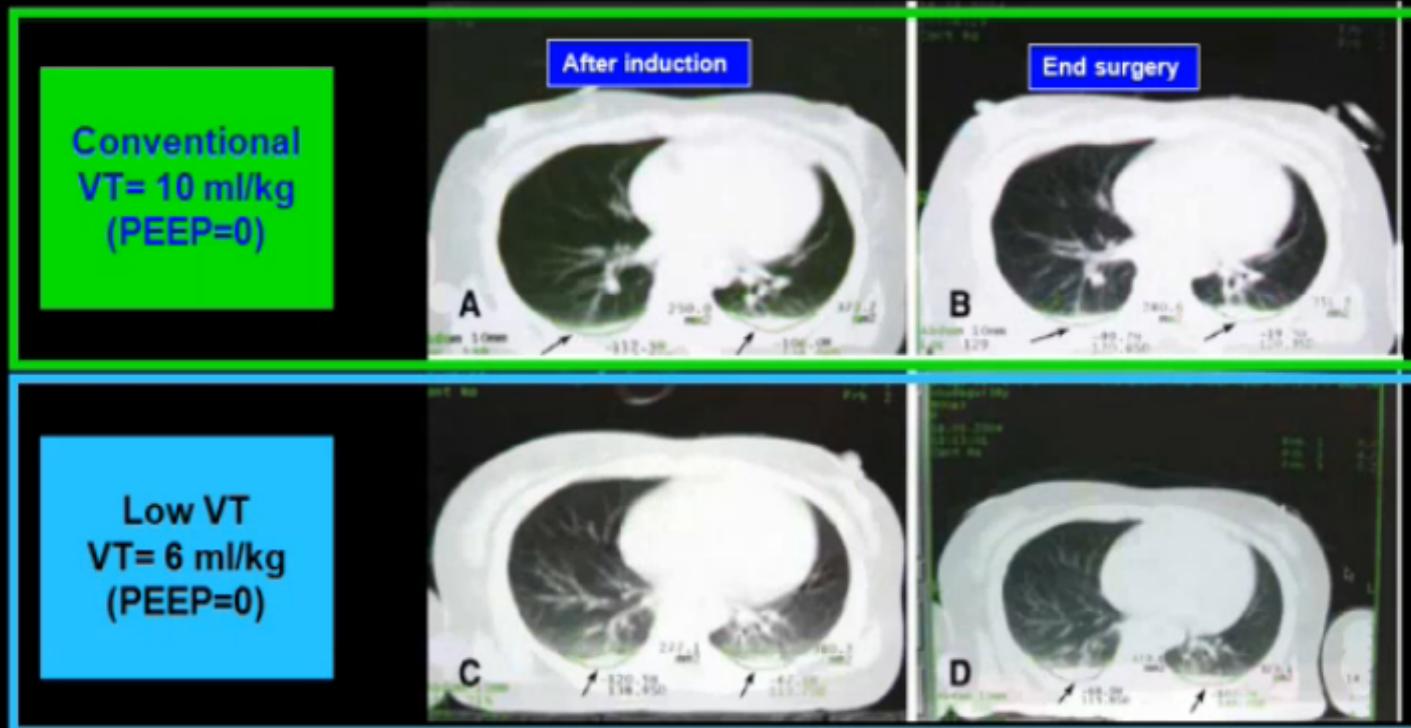

- Approximately 30% of patients still ventilated with $V_T \geq 10 \text{ ml} \cdot \text{kg}^{-1}$ IBW
- Female sex and BMI were independently associated with the use of high V_T

Low tidal volume does not promote atelectasis during general anesthesia

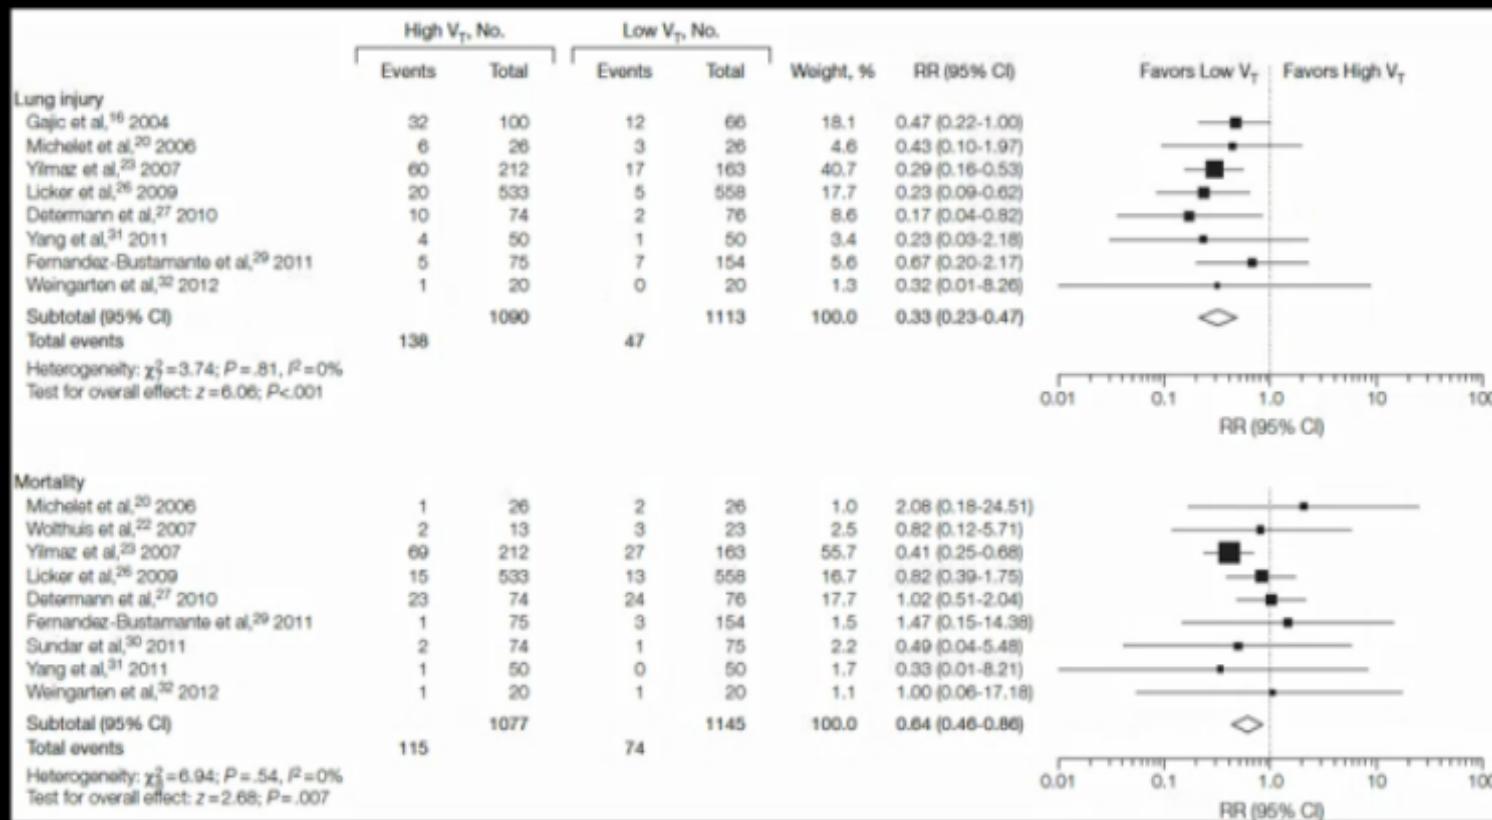

Hongwei C et al J Clinical Anesthesia 2007; 19:125-129

Atelectasis, as well as alveolar gas exchange, were comparable in patients with 6 or 10 mL/kg

Lower Tidal Volumes in Patients without Preexisting Lung Injury

Serpa Neto A et al, JAMA. 2012 Oct 24;308(16):1651-9

What to do ?

Pelosi P, Gregoretti C. Best Pract Res Clin Anaesthesiol. 2010 Jun;24(2):211-25

Airway closure

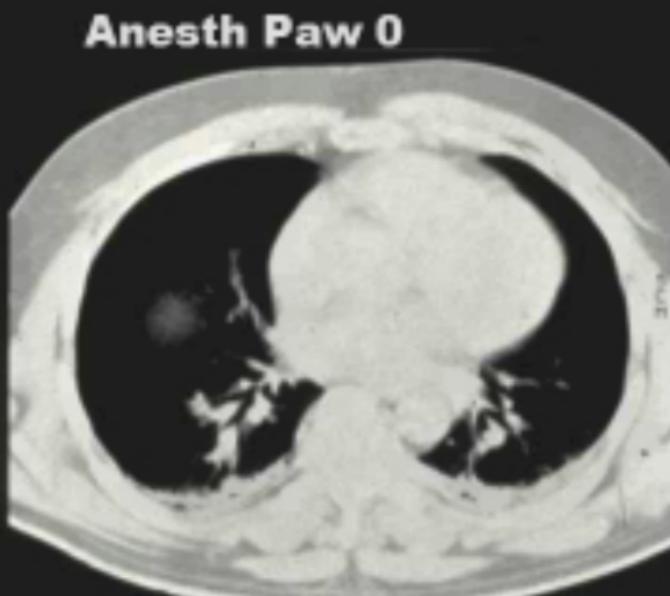

- Low Tidal Volume (<10 ml/Kg IBW)
- PEEP (to raise EELV)

Atelectasis

- Recruitment
- PEEP (keep the lung open)
- Avoid high F₁O₂ (<0.8)

Paw

Protective ventilation setting during general anesthesia ?

Shultz MJ et al Anesthesiology 2007; 106:1226-1231

Pelosi P and Rocco PR. Anesthesiology 2011; 115: 923-925

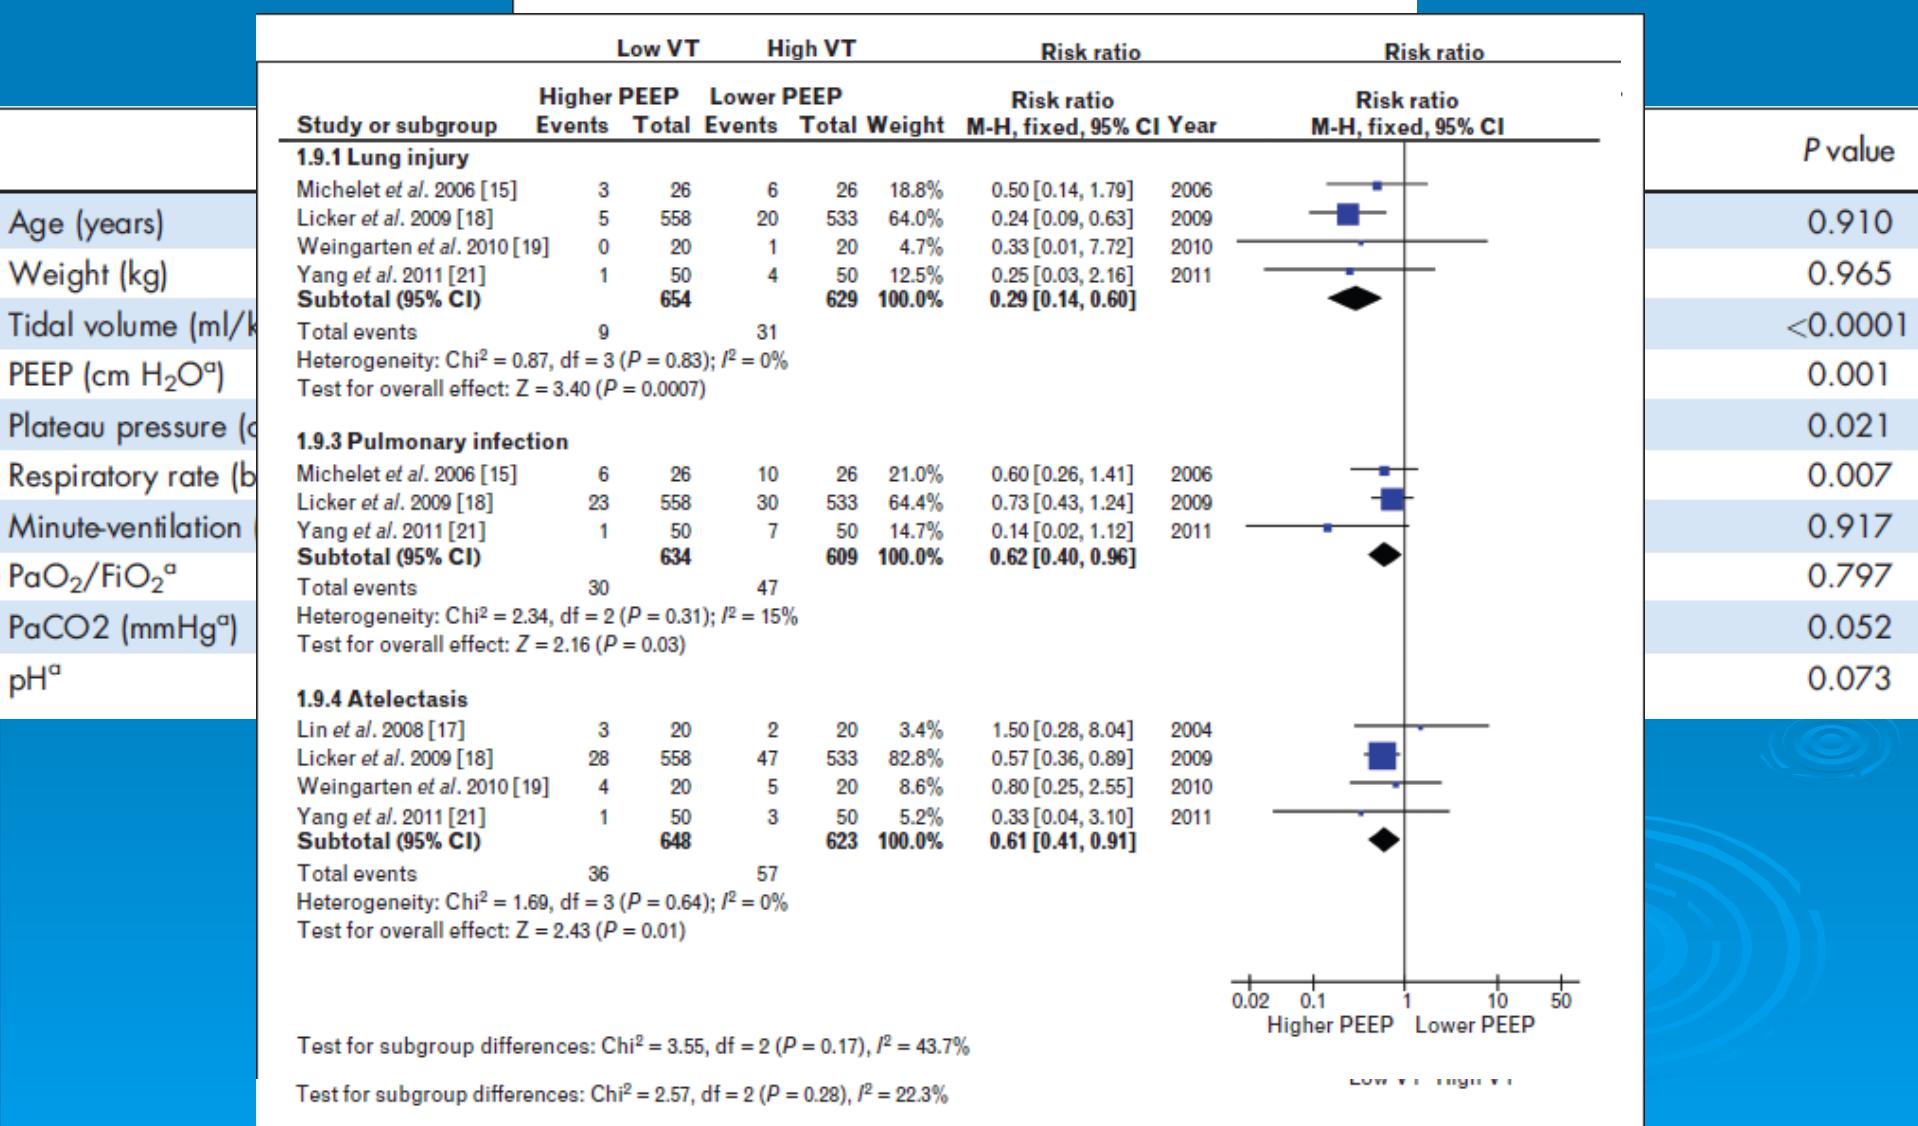

Pelosi P et al. Trends in Anaesthesia and Crit Care 2013; 3; 77-81

- Tidal Volume 6-8 ml/Kg PBW
- Increase RR to control pH_a/PaCO₂
- Plateau Pressure < 20 cmH₂O
- PEEP 5-10 cmH₂O
- RM 30-40 cmH₂O – PEEP/VT – PC/VC
- Monitor Paw-Time/Check PEEPi

Intraoperative ventilatory strategies to prevent PPCs: a meta-analysis

Protective Mechanical Ventilation during General Anesthesia for Open Abdominal Surgery Improves Postoperative Pulmonary Function

Severgnini P et al Anesthesiology. 118: 1307-1321 (2013)

Protective Ventilation

- VT = 7 ml/kg IBW
- PEEP = 10 cmH₂O
- Recruitment Manoeuvres after induction and before extubation :
Pplateau = 30-35 cmH₂O with increasing tidal volume at PEEP 10

Conventional Ventilation

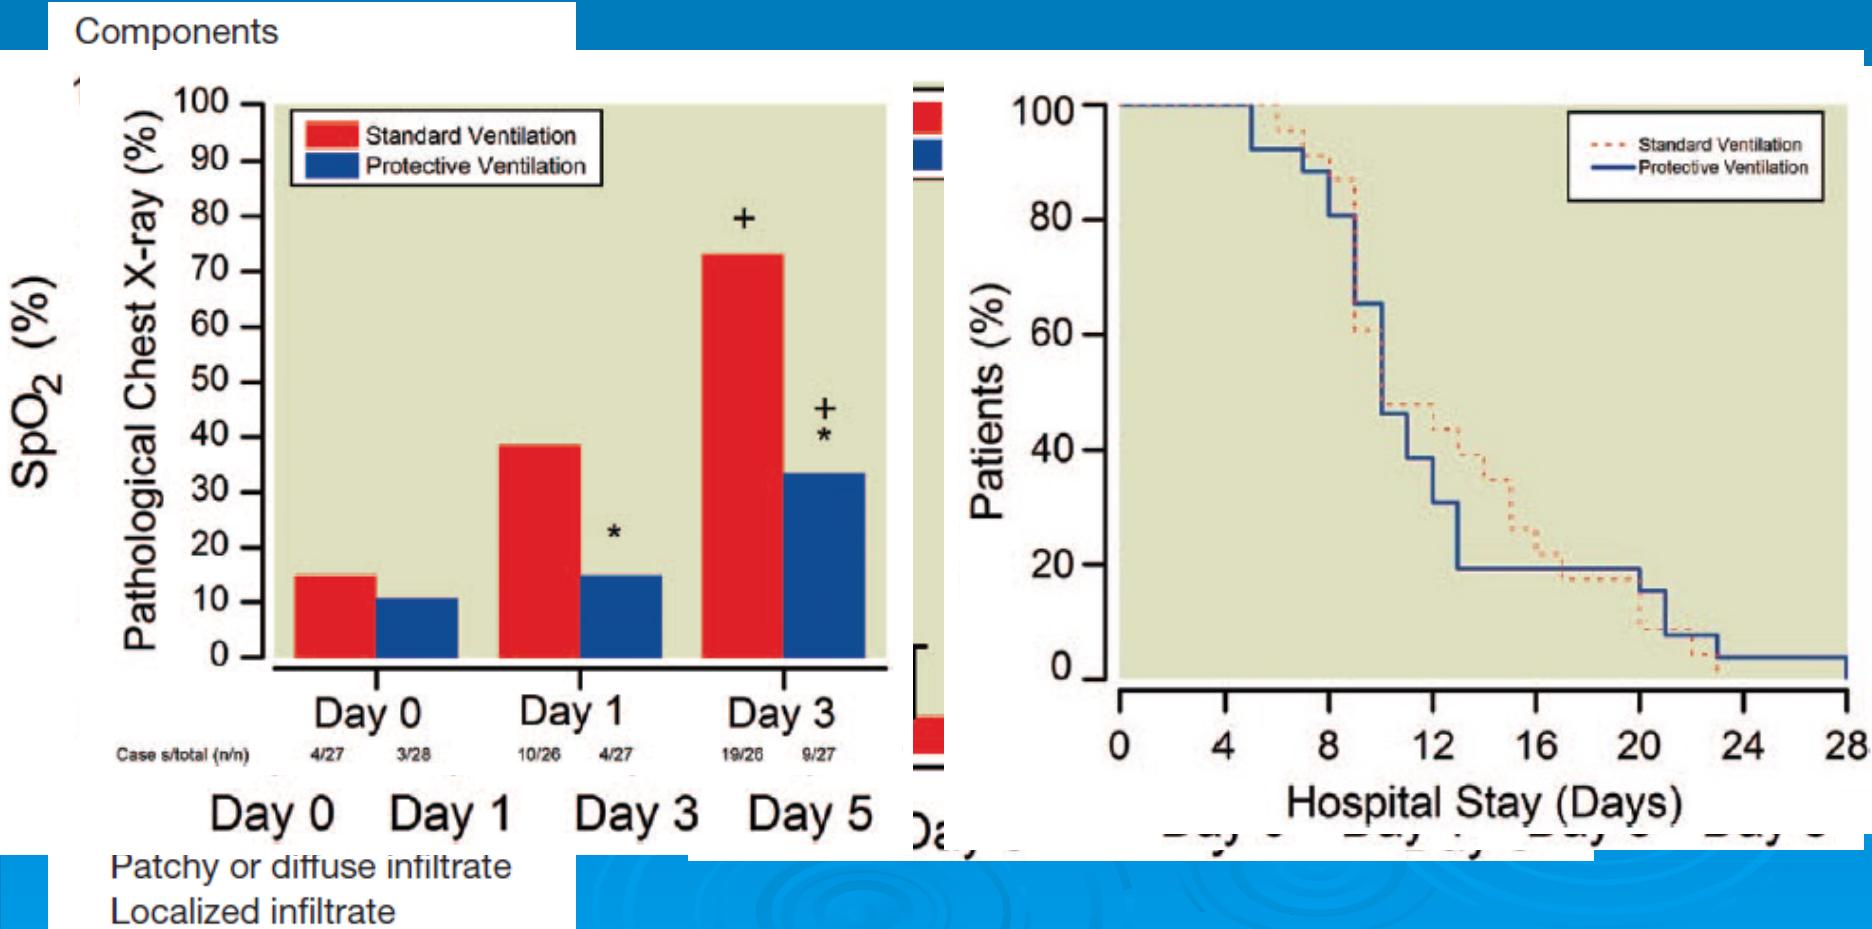

- VT = 9 ml/kg IBW
- PEEP = 0 cmH₂O
- No Recruitment Manoeuvres

30 < EtCO₂ < 40 mmHg e FiO₂ 50%

Protective Mechanical Ventilation during General Anesthesia for Open Abdominal Surgery Improves Postoperative Pulmonary Function

Anesthesiology 2013; 118:1307-21

Paolo Severgnini et al.

Emmanuel Futier and al.

A Trial of Intraoperative Lung Protective Ventilation in Abdominal Surgery

Lung-Protective Ventilation

- V_T 6 to 8 ml/kg PBW
- PEEP 6 to 8 cmH₂O
- Recruitment Maneuver

VS.

Traditional Ventilation

- V_T 10 to 12 ml/kg PBW
- No PEEP
- No Recruitment Maneuver

Recruitment maneuver = CPAP 30 cmH₂O during 30 sec

After intubation and every 30 min thereafter

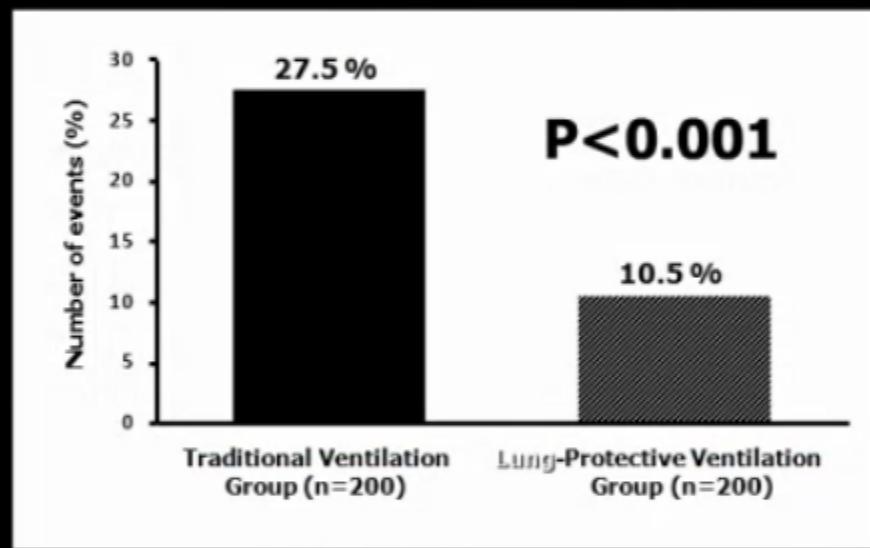

In both groups:

- Plateau pressure < 30 cmH₂O
- Volume-controlled ventilation mode
- FiO₂ adjusted to maintain SpO₂ ≥ 95%
- RR adjusted to maintain ETCO₂ between 35 and 40 mmHg

PRotectional Ventilation with Higher versus Lower PEEP during General Anesthesia
for Surgery in OBESE Patients

The PROBESE Randomized Controlled Trial

184 / 748 pts

News Letter 3

Dresden, April 21, 2015

PV: Thorax

«Protect» (*both the lung & its function*)

- Low FiO₂
- PEEP (and CPAP)
- Low TV; low driving pressures
- RM (and PEEP)
- Permissive Hypercapnia

Mert Senturk

EDITORIAL

How can we prevent postoperative pulmonary complications?

Marcelo G. de Abreu^a and Paolo Pelosi^b

Curr Opin Anesthesiol 2013, 26:105–106

The building of National and International Networks
run by Anesthesiologists

- Clinical studies and randomized controlled trials
- To generate clinical evidence
- To establish standards for improved clinical practice

An aerial photograph of the Dnieper Hydroelectric Station (Dnipro HES) in Zaporizhia, Ukraine. The image shows the massive concrete dam structure curving across the Dnieper River. To the left, the river flows through a city area with dense greenery and buildings. To the right, the reservoir created by the dam stretches far into the distance. In the foreground, there is a large industrial complex with several long, low-profile buildings, roads, and green spaces. A prominent feature is a large circular structure, likely a cooling tower or a part of the power plant's infrastructure. The water is a vibrant turquoise color.
